

Multidimensional Evaluation and Attribution Analysis of Food Inflation Forecast in Afghanistan. (a) Overview of the total cycle prediction and fitting, (b) Multi-step Short-Term Forecast Comparison Chart, (c) Details of Prediction Performance in Extreme Crisis Periods, (d) Pearson correlation analysis of macroeconomic drivers, (e) SHAP-based explanation of feature contributions for a specific prediction instance.

Food inflation in Afghanistan is essentially a survival inflation, characterized by macro-liquidity depletion and the collapse of the food supply system, following domestic political upheavals. With livelihoods heavily dependent on wheat and severely underdeveloped agricultural infrastructure, food prices lack buffers against climatic shocks or shifts in neighboring trade policies, leading to disruptive price jumps. Financially, Afghanistan faces a unique dilemma of currency isolation and asset limitation. The extreme shortage of foreign exchange reserves has eroded the capacity of private traders to stabilize the market through international imports. Consequently, sharp currency depreciation inflated imported food costs and triggered a deep collapse in purchasing power. Driven by economic cycles and the volatile nature of humanitarian aid linked to political fluctuations, the domestic market endures dual pressure from physical supply shortages and financial payment interruptions. Ultimately, Afghanistan exhibits an extremely irregular inflation profile caused by geopolitical asphyxiation and a marked departure from the global stability trends.
