

Multidimensional Evaluation and Attribution Analysis of Food Inflation Forecast in Romania. (a) Overview of the total cycle prediction and fitting, (b) Multi-step Short-Term Forecast Comparison Chart, (c) Details of Prediction Performance in Extreme Crisis Periods, (d) Pearson correlation analysis of macroeconomic drivers, (e) SHAP-based explanation of feature contributions for a specific prediction instance.

Characterized by its fundamental supply demand sensitivity, food inflation in Romania is rooted in structural and macroeconomic shifts rather than isolated price shocks. Systemic domestic baselines encompassing population growth, headline inflation, and GDP expansion exhibit exceptionally high alignment with food price movements, all of which maintain massive statistical coherence. Under high-volatility scenarios, further structural decomposition isolates a temporary decoupling dynamic between localized drivers, establishing that domestic food price trajectories can counterpoise broader systemic price surges, while long-term structural factors, including GDP trajectories along with demographic expansion, exert sustained upward pressures to reshape the country's baseline pricing mechanism. This inflation profile is driven by profound fundamental demand integration, further reinforced by localized structural transformations that dominate the overarching price transmission channel.
